Sorting

Upper and Lower bounds

[Aggarwal, Vitter, 88]
**Standard MergeSort**

*Merge* of two sorted sequences $\sim$ sequential access

$$\text{MergeSort: } O(N \log_2(N/M)/B) \text{ I/Os}$$
For $k$-way merge of sorted lists we need:

\[ M \geq B(k + 1) \iff M/B - 1 \geq k \]

- Number of I/Os: $2N/B$. 

**Multiway Merge**
Multiway MergeSort

• $N/M$ times sort $M$ elements internally $\Rightarrow N/M$ sorted runs of length $M$.

• Merge $k$ runs at at time, to produce $(N/M)/k$ sorted runs of length $kM$.

• Repeat: Merge $k$ runs at at time, to produce $(N/M)/k^2$ sorted runs of length $k^2M$, …

At most $\log_k N/M$ phases, each using $2N/B$ I/Os.

Best $k$: $M/B-1$.

$O(N/B \log_{M/B}(N/M))$ I/Os
Multiway MergeSort

\[ 1 + \log_{M/B}(x) = \log_{M/B}(M/B) + \log_{M/B}(x) = \log_{M/B}(x \cdot M/B) \]

\[ \downarrow \]

\[ O\left(\frac{N}{B} \log_{M/B}(\frac{N}{M})\right) = O\left(\frac{N}{B} \log_{M/B}(\frac{N}{B})\right) \]

Defining \( n = \frac{N}{B} \) and \( m = \frac{M}{B} \) we get

Multiway MergeSort: \( O\left(n \log_{m}(n)\right) \)
Sorting Lower Bound

Model of memory:

![RAM and Disk Diagram]

- Comparison based model: elements may be compared in internal memory. May be moved, copied, destroyed. Nothing else.
- Assume \( M \geq 2B \).
- May assume I/Os are block-aligned, and that at start, input contiguous in lowest positions on disk.
- Adversary argument: adversary gives order of elements in internal memory (chooses freely among consistent answers).
- Given an execution of a sorting algorithm: \( S_t = \) number of permutations consistent with knowledge of order after \( t \) I/Os.
Adversary Strategy

After an I/O, adversary must give new answer, i.e. must give order of elements currently in RAM.

If number of possible (i.e. consistent with current knowledge) orders is $X$, then there exist answer such that

$$S_{t+1} \geq S_t / X.$$ 

This is because any single answer induces a subset of the $S_t$ currently possible permutations (consisting of the permutations consistent with this answer), and the $X$ such subsets clearly form a partition of the $S_t$ permutations. If no subset has size $S_t / X$, the subsets cannot add up to $S_t$ permutations.

Adversary chooses answer fulfilling the inequality above.
### Possible X’s

<table>
<thead>
<tr>
<th>Type of I/O</th>
<th>Read untouched block</th>
<th>Read touched block</th>
<th>Write</th>
</tr>
</thead>
<tbody>
<tr>
<td>$X$</td>
<td>$(\binom{M}{B})B!$</td>
<td>$(\binom{M}{B})$</td>
<td>1</td>
</tr>
</tbody>
</table>

Note: at most $N/B$ I/0s on untouched blocks.

From $S_0 = N!$ and $S_{t+1} \geq S_t/X$ we get

$$S_t \geq \frac{N!}{(\binom{M}{B})^t (B!)^{N/B}}$$

Sorting algorithm cannot stop before $S_t = 1$. Thus,

$$1 \geq \frac{N!}{(\binom{M}{B})^t (B!)^{N/B}}$$

for any correct algorithm making $t$ I/Os.
Lower Bound Computation

\[ 1 \geq \frac{N!}{\left(\frac{M}{B}\right)^t (B!)^{N/B}} \]

\[ t \log \left(\frac{M}{B}\right) + (N/B) \log(B!) \geq \log(N!) \]

\[ 3tB \log(M/B) + N \log B \geq N(\log N - 1/ \ln 2) \]

\[ 3t \geq \frac{N(\log N - 1/ \ln 2 - \log B)}{B \log(M/B)} \]

\[ t = \Omega(N/B \log_{M/B}(N/B)) \]

Lemma was used:

a) \( \log(x!) \geq x(\log x - 1/ \ln 2) \)

b) \( \log(x!) \leq x \log x \)

c) \( \log \left(\frac{x}{y}\right) \leq 3y \log(x/y) \) when \( x \geq 2y \)
Proof of Lemma

Lemma:

a) \[ \log(x!) \geq x(\log x - 1/\ln 2) \]

b) \[ \log(x!) \leq x \log x \]

c) \[ \log \left( \frac{x}{y} \right) \leq 3y \log(x/y) \text{ when } x \geq 2y \]

Stirlings formula: \[ x! = \sqrt{2\pi x} \cdot (x/e)^x \cdot (1 + O(1/12x)) \]

Proof (using Stirling):

a) \[ \log(x!) \geq \log(\sqrt{2\pi x}) + x(\log x - 1/\ln 2) + o(1) \]

b) \[ \log(x!) \leq \log(x^x) = x \log x \]

c) \[ \log \left( \frac{x}{y} \right) \leq \log \left( \frac{x^y}{(y/e)^y} \right) = y(\log(x/y) + \log(e)) \leq 3y \log(x/y) \text{ when } x \geq 2y \]
The I/O-Complexity of Sorting

Defining

\[ \begin{align*}
  n &= N/B \\
  m &= M/B \\
  N/B \log_{M/B}(N/B) &= \text{sort}(N)
\end{align*} \]

we have proven

I/O cost of sorting:

\[
\Theta\left(\frac{N}{B} \log_{M/B}(\frac{N}{B})\right) \\
= \Theta(n \log_m(n)) \\
= \Theta(\text{sort}(N))
\]
